Website Consultation Form Integration

Add the Hearing Store "Free Consultation" popup to the WordPress site. Five minutes, one script tag.

1. What this is

A hosted lead form that runs on the CRM server (`https://crm.zenhear.com`) and opens as a **popup on the WordPress site**. Visitors never leave the page, and each submission goes straight into the CRM as a lead, deal and follow-up for the team.

- No plugin, no API key and no secret are needed on the website.
- One `<script>` tag adds a **floating button (bottom-right)** and makes any `#crm-lead-form` link open the popup.
- The existing **WhatsApp button stays on the left**; this button sits on the right.

Item	Value
Popup script	`https://crm.zenhear.com/f/consultation/embed.js`
Direct form link	`https://crm.zenhear.com/f/consultation`
Trigger link	`#crm-lead-form` (or CSS class `crm-lead-popup`)
Fields	Name*, Mobile* (BD format), Interest (chips), Email, Message

2. Installation (5 minutes)

Step 1 – Add the script once, site-wide (footer)

Use **WPCode** (Code Snippets → Header & Footer → *Footer*) or the theme's footer hook:

```
<script src="https://crm.zenhear.com/f/consultation/embed.js" data-label="Free Consultation" asy
nc></script>
```

Theme alternative (`functions.php`):

```
add_action('wp_footer', function () {
    echo '<script src="https://crm.zenhear.com/f/consultation/embed.js" data-label="Free Consult
ation" async></script>';
});
```

Step 2 – Connect the site buttons

Set the link of every "Free Consultation" / "Get Consultation" button to `#crm-lead-form`

Editor	Where
Elementor	Button → Content → Link → `#crm-lead-form`
Gutenberg	Button → Link → `#crm-lead-form`
Menu	Appearance → Menus → Custom Link → URL `#crm-lead-form`
Custom HTML	`<a href="#crm-lead-form">Free Consultation</a>` or `<button class="crm-lead-popup">…</button>`

Step 3 – Clear cache

Purge WP Rocket / LiteSpeed / Cloudflare cache after saving.

3. Options (attributes on the script tag)

Attribute	Default	Effect
`data-label="..."`	Get free consultation	Floating button text (Bangla is fine, e.g. ফ্রি পরামর্শ)
`data-button="false"`	shown	Hide the floating button; only your own `#crm-lead-form` buttons open the popup
`data-auto-open="20"`	off	Open once per visit after N seconds (not again after it was opened or submitted)

```
<script src="https://crm.zenhear.com/f/consultation/embed.js"
        data-label="ফ্রি পরামর্শ" data-auto-open="25" async></script>
```

4. JavaScript API & tracking

```
CRMLeadForm.open();   // open the popup from your own code
CRMLeadForm.close();  // close it
```

Conversion tracking: after a successful submission the script pushes to Google Tag Manager:

```
window.dataLayer.push({ event: 'crm_lead_submitted' });
```

Create a GTM trigger on the custom event `crm_lead_submitted` for GA4 / Meta Pixel / Google Ads conversions.

> **Source tracking is automatic:** the page URL and any `utm_source`, `utm_medium`, `utm_campaign` are sent with the lead, so the CRM shows which page or campaign each lead came from. Keep UTM tags on ad links.

5. Behaviour (UX)

- Popup: centred card on desktop; slides up from the bottom on mobile.
- Close: ✕ button, click outside, or `Esc`.

- After submit: "Thank you" screen (English + Bangla) with a **Close** button; auto-closes after 8 s. The visitor stays on the same page.
- Direct link (Facebook/SMS): full page with a ← **Back to website** button (returns to the referring page, else hearingstore.com.bd).
- Branding: Hearing Store logo, green gradient with a thin red brand accent.
- Mobile number must be Bangladeshi (`01XXXXXXXXX` , `+8801…` accepted).

6. Security & compatibility

- **No secrets in the browser.** The form uses a signed time token, a honeypot field, rate limits and a blocklist on the CRM side. Spam is filtered automatically.
- The form loads in an **iframe** from `crm.zenhear.com` . If the site sends a Content-Security-Policy, allow:

```
script-src  https://crm.zenhear.com;
frame-src   https://crm.zenhear.com;
```

- Security plugins (Wordfence, iThemes) need no changes. Only strict CSP headers would block it.
- Script is about 5 KB, loads `async` , needs no jQuery and does not block rendering.
- Button/popup z-index is very high (`2147483000+`). If a chat widget sits bottom-right, move one of them.

> **Please do not copy the form HTML into WordPress.** Always load the script, so design and logic updates from the CRM apply automatically.

7. Testing checklist

1. Open the site in an incognito window → green button bottom-right, WhatsApp still on the left.
2. Click a page button linked to `#crm-lead-form` → popup opens.
3. Submit a test with a real BD number → "Thank you" → popup closes, same page.
4. Ask the CRM admin to confirm the lead in **Website Leads** and on the **Deals** board.
5. (If GTM used) check the `crm_lead_submitted` event in GTM Preview.

8. Troubleshooting

Problem	Fix
Button not showing	Clear all caches; confirm the script is in the page source (footer); check the browser console for CSP errors
Popup opens but is blank	CSP `frame-src` is blocking `crm.zenhear.com`
`#crm-lead-form` jumps to top	Script not loaded on that page, or the page builder rewrote the link. Use class `crm-lead-popup` instead
"Please enter a valid mobile number"	Only Bangladeshi mobile numbers are accepted
Overlaps another widget	Use `data-button="false"` with page buttons, or move the other widget

9. Future domain change

The CRM will later move from `crm.zenhear.com` to a final domain. Only the domain in the `<script src="...">` tag will change, and the old address will redirect for a transition period.

Contact: Hearing Store CRM admin, for form changes, new forms (other landing pages can have their own form/link) or lead questions.
